MA in Global Visual Communication .................................................11

2 Research-Only PhD Program .........................................................12
1 Academic Master’s Program Global Visual Communication (GVC)

1.1 Program Orientation
The program is based on a sound methodological foundation in the Integrated Social Sciences. The MA in Global Visual Communication provides knowledge and research tools in order to understand the growing relevance of communication patterns transcending national and cultural boundaries. These communication phenomena are scrutinized from five different perspectives: comparative communication, visual communication, transnational/global communication, globalizing media, communication, culture and critique. Thereby, students acquire a solid understanding of ongoing media and communication trends and of the increasing importance of mediated communication in a globalized environment.

This MA aims primarily at students with a social science background. The program also puts a strong emphasis on key analytical and methodological skills.

1.2 Program Design
The MA in Global Visual Communication provides students with the competencies necessary to understand both, the contemporary structures, functions and patterns of international, transnational and global communication and the fundamental changes that media and communication systems are subject to. Mass and network media are shaped by internationalization and globalization. At the same time media are also shaping those processes, which currently transform nations, societies and cultures. National systems have become less contained and more open for international influences. The acceleration of these exchange processes among media producing and media consuming countries has been furthered by a visualization trend that can be observed worldwide. Thus, the program places particular emphasis on the dynamics of internationalization and visualization that transform national communication systems and complement them with transnational/global elements.

1.3 Job Perspectives
The MA program provides conceptual schemes, factual knowledge, and methodological skills of major importance for a range of job activities in highly qualified service professions. This applies in particular for professions concerned with planning, consulting, evaluation and campaigning tasks, as they are performed in public administration, international organizations, private business, private and public media and non-governmental organizations. Also, the MA degree prepares for applied and academic research, in particular PhD-programs, including the PhD-Research program in Integrated Social Sciences (ISS).
1.4 Module Areas

The program is divided into four overarching areas, as follows:

- The Methods Thematic Area (M1) comprises two methods modules.
- The Specific Thematic Area (M2) comprises five modules. The modules consist of a foundations seminar and an issues seminar.
- The Optional Area (M3) is covered by any graduate course from the social sciences or humanities at Jacobs University (excepting the Research Colloquium, see M4 below).
- The Research Area (M4) is covered by the Research Colloquium, which MA students are required to attend during their fourth semester of study while writing their MA thesis.

The courses provide insights indicated in the general module description but vary in focus regarding the area of exemplification chosen to demonstrate these insights. A particular focus can be indicated as a subtitle to the module title.

1.4.1 Methods Thematic Area (M1)

This area realizes the insight that the social sciences share a common pool of methodological tools and that any further specialization requires a basic understanding of social science methods.
Methods provide the practical tools necessary to conduct theory-driven research. Because methods become ever more sophisticated it is of critical importance that students acquire a sound understanding of methods. The two methods modules widen this understanding and improve the students’ technical mastery of various practices. Thus, students acquire highly relevant skills that apply to all fields of professional activities involving analytical tasks.

**Module M111 „Advanced Quantitative Methods”**

The module aims at improving the mastery of quantitative methods, that is, research techniques in which measurement, numbers, and statistics play a crucial role. A handling of quantitative methods becomes ever more critical in an era in which the advance of information technology leads to an unprecedented expansion of sociometrics and manifold forms of quantification. Thus, students are familiarized with the logics of large-N comparison, standardized survey methods, coding and scaling construction, quantitative content analysis, time-series analyses, multivariate analyses, multi-level analyses. The selection of methods as well as the focus on particular techniques can vary as long as students obtain an overview of the variety of approaches.

**Module M112 „Advanced Qualitative Methods”**

Both qualitative and quantitative methods gain insights from empirical material. The scientific procedure differs insofar as qualitative methods use textual or visual information rather than numerical data. The module familiarizes students with the logics and handling of qualitative methods, covering such topics as the logic of small-N comparison, purposive sampling
and research design, qualitative interviewing, observation, coding of texts and visuals, content analysis, image analysis, discourse analysis, typologies, or hermeneutics. The combination of topics can vary as long as an overview of the diversity in the field is provided.

Students mandated to take the course "Advanced Quantitative Methods" are required to participate in a placement test of their knowledge of quantitative research methods and statistics. The results of this placement test will form the basis for a recommendation regarding which courses from the Jacobs University undergraduate curriculum the students should take to remedy any potential gaps in statistics knowledge. As from the Academic Year 2009/10 onwards, recommendations made on the basis of the placement test will encompass the possibility to mandate students to register for undergraduate courses and complete the courses successfully (i.e., with at least a passing grade).

Recommendations made after the placement test can be fourfold:
(1) Students whose knowledge of quantitative research methods and statistics is sufficient to successfully take the course "Advanced Quantitative Methods" will be exempt from taking any undergraduate methods courses for remedial purposes;
(2) Students with a good basic knowledge in quantitative research methods and statistics will be advised to take the undergraduate course "Statistics II" in their first semester at Jacobs University, without making a successful and graded completion of this course mandatory;
(3) Students with a basic knowledge of quantitative research methods, but little or no knowledge in the field of statistics will be mandated to take the undergraduate course "Statistics I", in parallel to the "Advanced Quantitative Methods" course, and can only receive a passing grade in the latter course when they also receive a passing grade in the former course;
(4) Students with no knowledge and experience of either quantitative research methods or statistics will be mandated to take the undergraduate course "Qualitative and Quantitative Research Methods" in their first study semester and the "Statistics I" course in their second study semester, and will be required to successfully complete both courses (i.e., receive a passing grade in both courses).

1.4.2 Global Visual Communication

This Master's program provides students with the competencies necessary to understand the complex structures of contemporary media and communication systems, their transformations and upheavals, as well as their particular role in globalization.

Mass and network communication is less confined to national borders than ever before. Technological changes such as the proliferation of the Internet and mobile devices have facilitated global flows of information and entertainment visually and verbally. There emerged a tendency towards the domination of visual information in international, transnational and global communication. From Internet websites to advertising, from art to photography and film industry, mass and network communication employ visuals that
provide wider international reach and exercise deeper emotional appeal. People of all generations are becoming active producers and consumers of visual culture. Due to the expansion of digital technology and the shifts in social interaction, expertise in visual communication and design becomes essential for meeting the global challenges of education and communication.

The Master's Program in Global Visual Communication is based on a transdisciplinary curriculum that provides students with advance knowledge in the field of communication studies related to the following areas: transnational and global communication, new media and the decline of traditional media institutions, the role of visuals in today's mass and network communication, visual communication and identity formation, Internet-based media and democracy, global network studies. Addressing the recent trends in international, transnational and global mass and network communication from different theoretical, methodological and empirical perspectives, the first module M221 provides students both with comparative methodological tools and a visually comparative perspective; the second module M222 focuses on visual media and their role in international, transnational and global communication, while the third module M223 scrutinizes the very current and complex phenomena of transnational and global communication patterns. Module M224 focuses on globalizing media, i.e. those media, which are of special relevance for processes of globalization, like satellite television, inter- and intranet, mobile communication and ensuing social, economic, political, and cultural networking. Module M225 will provide the necessary contextualizations of communication, culture, and critique, but is not subdivided into two (foundations and issues) seminars.

**Module M221 „Comparative Communication“**

This module familiarizes students with the comparative analysis and synopsis of visual media production, distribution, networking and cultural participation processes. The module consistently scrutinizes the socio-economic, technological, cultural and political contexts and configurations, which shape visual communication and visual media and are in turn shaped by the latter. On the macro level cross-national and cross-cultural comparisons as well as comparisons between local, regional, national and global media will be conducted. On the micro level media usage is compared both across different countries and across different audience, market or public sphere segments defined by age, gender, social status and the like. The method of comparison is thus applied to various social and political levels, ranging from country-specific case studies, regional, national and global comparisons to comparisons among different segments of society. The comparative approach is further applied to multimodal comparisons of different types of visual media, ranging from print to broadcast, satellite, mobile and network media, their similarities and differences. Students are trained in identifying such differences and similarities as well as detecting and analyzing the underlying forces and structures that lead to their persistence or dissolution.
Module M222 „Visual Communication“

Visualization is one of the most prominent features in international, transnational and global communication. This module focuses on the structures, functions as well as on the formats and contents of visual communication. Visual and textual aspects of communication are complementary, but visual communication transcends national borders more easily, for images are (at least on the level of human perception) not restricted by language barriers. Textual communication also follows a different communication pattern than visual communication. While media texts are usually read and interpreted according to an underlying argumentative structure, the logic of media visuals is rather based on association. As a consequence the global transfer of visual mass and network media products appears to be easy, because no translation seems to be necessary. But visuals from other cultures can violate cultural and religious traditions and thus create social and political tension. Moreover, visual content is interpreted in different ways around the world. The contextualization of visual communication in terms of its role in mixed sign systems, especially in audio-visual communication is thus an important aspect of this module. Students learn how the social, political and cultural configurations in which visual media are perceived are crucial for comprehending the structures, functions and messages of global visual communication.

Module M223 „Transnational and Global Communication“

This module covers communication processes that cross the borders of national societies, cultures and milieus or that transcend such demarcations altogether. Topics include: the cross-border flow of information and entertainment, the establishment of transnational or global media offerings such as satellite television or the World Wide Web, the emergence of hybrid media cultures as well as the mobile communication environments of migrant communities or transnational elites. The module links communication to the processes of political, cultural and economic transnationalization and the emergence of cross-cultural networks: Are these different developments synchronous or asynchronous, and which links can be discerned between them? Answering these questions will clarify, among other things, the propensity of the different visual media to foster the emergence of transnational or global audiences, markets or public spheres, to provide opportunities for transnational civil society actors and to facilitate dialogue in situations of conflict and war. Students will thus explore the factors hindering and facilitating the production of shared visual meaning across different socio-economic, technological, cultural and political contexts: from transnational and transcultural to global visual communication.

Module M224 “Globalizing Media”

As we have learned to think in terms of multiple modernizations and globalizations, we have to realize various modes and rhythms of the developments of different types of networks. The rise of variously knit and cut
off network societies in formation (they still lack the coherence, institutional stability, loyalty and history of societies in the traditional sense) rocks usually pre-given references. “We” against “Them” is no longer obvious, the more so for mass and network mediated visual re-/presentations (still and at times even increasingly) show nation state oriented perspectives. Therefore, this module will familiarize the students with various perspectives on globalizing media, i.e. those media, which are of special relevance for processes of globalization, like satellite television, inter- and intranet, mobile communication and ensuing social, economic, political, and cultural networking and focus on those theories of globalization, which take into account the special role of mass and network media. Thereby, the students shall be prepared for professions in transnational and global contexts.

Module M225 “Communication, Culture and Critique”

This module offers a broad overview of those theories in the social sciences and the humanities, which have focused on (global) visual communication.

1.4.3 Optional Area (M3)

This area has no predefined thematic focus. It intends to provide students an opportunity to extend their knowledge into an area of their individual choice within the School of Humanities and Social Sciences, including courses in the IR program that Jacobs University Bremen and Universität Bremen run jointly. Thus, any graduate course offered within the school is eligible to cover this module (excepting the Research Colloquium). It offers also faculty an opportunity to hold courses on more specific topics in the centre of their own research as well as additional courses by media professionals on new types of screen media productions, e.g., blogging or for mobile devices. We also recommend an internship of 2 months after the first year.

1.4.4 Research Area (M4)

The research area is covered by the Research Colloquium, which takes place every semester. Its purpose is to familiarize students with concrete problems in the actual practice of comparative empirical research. While the attendance of the Research Colloquium is mandatory only in the fourth semester, regular attendance throughout the first three semesters of study is strongly recommended.
1.5 Study Organization

All MA students in GVC take nine courses in the five specific modules of their section and two methods courses.

To cover the optional thematic module, students take one graduate course of their choice from the Humanities Program. Alternatively, the optional module can be covered by taking a course, which is offered explicitly as an optional social science graduate course. To cover the research module all second year students participate in their fourth semester in the research colloquium.

The usual requirements for each graduate course include (additional requirements not being foreclosed):

- Regular reading of the mandatory literature
- Active participation in class discussions
- In-class presentations
- Producing reviews (500-1,000 words) and research papers (4,000-6,000 words).

The usual workload of graduate courses is as follows (deviations in specific cases not foreclosed):

- Course attendance and participation: 35 hours
- Course reading: 70 hours
- Presentation, research, writing: 120 hours
- Total: 225 hours = 7.5 ECTS.

2 Research-Only PhD Program

Commencing in the Academic Year 2008/09 doctoral education in the social sciences at Jacobs University has in essence become an integral part of the newly founded Bremen International Graduate School of Social Sciences (B\textsuperscript{I}GSSS). B\textsuperscript{I}GSSS is an inter-university graduate school run jointly by the Universität Bremen and Jacobs University, funded by the Deutsche Forschungsgemeinschaft (DFG) in the framework of the so-called Excellence Initiative Program of the Federal Government and the German Länder. It offers structured doctoral education based on a core curriculum. Under the umbrella topic “The Future of Social and Political Integration” B\textsuperscript{I}GSSS caters doctoral education and research in five substantive fields, namely (1) Global Integration, (2) Integration and Diversity in the New Europe, (3) Social Integration and the Welfare State, (4) Attitude Formation, Value Change, and Intercultural Communication, and (5) Life-Course and Lifespan Dynamics. One major asset of B\textsuperscript{I}GSSS is its interdisciplinary approach to doctoral studies, encompassing sociology, political science, and psychology as its three central pillars, but also encouraging the inclusion of economics, law, communication, education, and history-related topics. All details of the application procedure of B\textsuperscript{I}GSSS can be obtained from the separate B\textsuperscript{I}GSSS website: www.bigsss-bremen.de.

Individuals whose interests lie within the field of the social sciences, but are not sufficiently covered by one of the five topical fields of B\textsuperscript{I}GSSS may apply for Jacobs University’s Research-Only-PhD Program in Integrated Social Sciences (ISS) in the regular formal application process of this university. While also—like B\textsuperscript{I}GSSS—favoring an interdisciplinary orientation, this program is open to research projects with a primary focus on one of the following disciplines: sociology, political science, mass communication, or economics. Ideally, the research projects combine two or more of the above-mentioned disciplinary perspectives. Area-studies and case studies are only considered, if their comparative implications are made evident. Research projects in the domain of global visual communication explore the factors that hinder and facilitate the production of shared visual meaning across different socio-economic, technological, cultural and political contexts: from transnational and transcultural to global visual communication.

The program consists of three years of PhD-study. Major work includes the program-guided development, elaboration, and finalization of the research plan, resulting in a dissertation. Every student in the program develops a PhD Proposal in cooperation with a PhD Advisor. This Proposal is a written document and presented in public upon invitation by the Dean at most eight months after the qualifying exam or after entrance into the PhD Program. The Dissertation Committee approves the PhD Proposal, which is required not to exceed 6000 words. In addition, active participation in all program activities is required. As part of their training, supervisees are expected to assist in teaching and in research activities and to participate in the preparation of further program events. Only in very rare cases, will admission to Jacobs
University’s Research-Only-PhD Program be accompanied by a stipend-offer. Admission is thus handled very restrictively and will most likely only be granted if an applicant is receiving a stipend or other funding from a source other than Jacobs University, and provides supportive evidence for this.

For formal requirements of admission please check: http://www.jacobs-university.de/admission/graduate/
